

Task 3: MVC: is a pattern in software design commonly used to implement user interfaces, data, and controlling logic

It emphasizes a separation between the software's business logic and display.

We have

Model: this is managing data and business logic It manages the data, the rules, and the logic of what your app does.

View: handle layout and display

Controller: giving command to the model and view

We start from model where we define rules ,logic data structure and then we go through view where we define display and finally to controller where we have control logic we will give output based on instruction
